

EE79691124345 A

THE ASSISTANT COMMISSIONER OF PATENTS
Washington, D.C. 20231

DOCKET NUMBER: AT9-98-340

Date: 11-6-98

Sir:

Transmitted herewith for filing is the Patent Application of:

Inventor: Peter Y. Hsu et al.

For: BOOKMARKING OF WEB PAGE FRAMES IN WORLD WIDE WEB FOR ACCESSING WEB PAGES WITHIN A FRAMES IMPLEMENTATION

Enclosed are:

- ☒ Patent Specification and Declaration (2)
- ☒ 8 sheets of drawing(s).
- ☒ An assignment of the invention to International Business Machines Corporation (includes Recordation Form Cover Sheet).
- ☐ A certified copy of a application.
- ☒ Information Disclosure Statement.

The filing fee has been calculated as shown below:

For	Number Filed	Number Extra	Rate	Fee
Basic Fee				\$790
Total Claims	21 - 20	1	x 22 =	\$ 22
Indep. Claims	3 - 3	0	x 82 =	\$ 0
MULTIPLE DEPENDENT CLAIM PRESENTED			x 270 =	\$ 0
			TOTAL	\$812

☒ Please charge my Deposit Account No. 09-0447 in the amount of \$812.00. A duplicate copy of this sheet is enclosed.

☒ The Commissioner is hereby authorized to charge payment of the following fees associated with this communication or credit any overpayment to Deposit Account 09-0447. A duplicate copy of this sheet is enclosed.

☒ Any additional filing fees required under 37 CFR §1.16.

☒ Any patent application processing fees under 37 CFR §1.17.

Respectfully submitted,

By:

Richard A. Henkler

**BOOKMARKING OF WEB PAGE FRAMES IN WORLD WIDE WEB
FOR ACCESSING WEB PAGES WITHIN A FRAMES IMPLEMENTATION**

Technical Field

The present invention relates to computer managed
5 communication networks, such as the world wide web, and
particularly to ease of use of interactive computer
controlled display interfaces to networks for
substantially reducing the time and resources required to
access portions of complex and/or lengthy web pages.

10 Background of the Invention

The 1990's decade has been marked by a technological
revolution driven by the convergence of the data
processing industry with the consumer electronics
industry. The effect has in turn driven technologies
15 which have been known and available but relatively
quiescent over the years. A major one of these
technologies is the internet related distribution of
documents, media and programs. The convergence of the
electronic entertainment and consumer industries with
20 data processing exponentially accelerated the demand for
wide ranging communications distribution channels and the
World Wide Web (Web) or Internet, which had quietly
existed for over a generation as a loose academic and
government data distribution facility, reached "critical
25 mass" and commenced a period of phenomenal expansion.
With this expansion, businesses and consumers have direct
access to all matter of documents, media and computer
programs.

In addition, Hypertext Markup Language (HTML), which
30 had been the documentation language of the Internet or
Web for years, offered direct links between pages and

SECRET 49306T50

other documentation on the Web and a variety of related data sources which were at first text and then evolved into media, i.e. "hypermedia". This even further exploded the use of the Internet or Web. It was now possible for the Web browser or wanderer to spend literally hours going through document after document and accompanying media events in often less than productive excursions through the Web. These excursions often strained the user's time and resources. In order for the Internet to mature to its great expectations to solid commercial fruition, it will be necessary for the Internet to greatly reduce its drain on time and related resources. A significant source of this drain is in the Web page, the basic document page of the Web. Web pages still do not have much in the way of interface standards. Although many Web pages are professionally designed and, thus, relatively efficient to use, there are still a great many Web pages which are very cumbersome to access and to use. This may be due to the length and organization of the page which causes the user to load and then scroll through the lengthy page to reach the area of interest on the page. Even lengthy Web page browsing cycles in reaching areas of interest would be tolerable if the user could, upon finding the area, create a bookmark which would take him directly to the page area or section without going through the process of bookmarking and thereby accessing the entire long Web page and then going through the page until the area of interest is reached.

30 Summary of the Invention

The present invention overcomes these prior art problems by providing a method and program whereby a user

2025 RELEASE UNDER E.O. 14176

may easily bookmark sections of a network, e.g. Web transmitted documents. The user then has the option of bookmarking the whole document or just sections of the document. The invention is directed to a computer
5 managed communication network, such as the Web, with user access via a plurality of data processor controlled interactive display stations and with a system for displaying documents, e.g. Web pages transmitted to said display stations from locations remote from said
10 stations. The invention provides for the conventional means associated with one of said receiving display stations for bookmarking selected transmitted documents, e.g. whole Web pages to thereby store at said receiving display station, direct links to the documents for future
15 access. In combination with this function, the invention provides the document or Web page creator with the facility of defining one or more sections of the document or Web page as independent secondary documents together with the facility at the receiving display station for
20 optionally bookmarking any secondary document to thereby store at the receiving display station, a direct link to the secondary document without accessing and first passing through the basic transmitted document. The invention is implemented by designing both the basic and
25 secondary documents as hypertext, particularly HTML documents, and defining the secondary documents within the basic document or Web page through the use of JavaScript.

It should be noted that while the secondary or
30 framed documents may be bookmarked so that they may be accessed without first accessing or going through their primary transmitted document, i.e. the Web page, nonetheless a feature of the present invention is that

0915054-1398

once the secondary document is, thus, directly accessed, its related Web page and, consequently, other secondary documents on the Web page may then be accessed through the accessed bookmarked secondary document.

5 Brief Description of the Drawings

Fig. 1 is a block diagram of a data processing system including a central processing unit and network connections via a communications adapter which is capable of implementing the receiving display station on which the received Web page may be processed in accordance with the present invention;

Fig. 2 is a generalized diagrammatic view of an Internet portion upon which the present invention may be implemented;

15 Fig. 3 is a diagrammatic illustration of a display screen showing a portion of a Web page having a defined frame at an initial stage in bookmarking the frame;

Fig. 4 is the display screen of Fig. 3 at a next stage in bookmarking the frame;

20 Fig. 5 is the display screen of Fig. 4 at a final
stage of bookmarking the frame;

Fig. 6 is a general flowchart of a programming set up to implement the present invention for bookmarking secondary pages defined by frames in a Web page;

25 Fig 7 is a flowchart of an illustrative run of the
program set up in Fig. 6; and

Fig. 8 is a diagrammatic illustration of the data structure supporting the primary Web page and several secondary framed documents on said Web page to show their relationship.

Detailed Description of the Preferred Embodiment

Referring to Fig. 1, a typical data processing terminal is shown which may function as a basic computer controlled network receiving terminal used in
5 implementing the present invention for the bookmarking of secondary pages defined by frames in received Web pages. A central processing unit (CPU) 10, such as one of the PC microprocessors or workstations, e.g. RISC System/6000^(TM) (RS/6000) (RISC System/6000 is a trademark of
10 International Business Machines Corporation) series available from International Business Machines Corporation (IBM), is provided and interconnected to various other components by system bus 12. An operating system 41 runs on CPU 10, provides control and is used to
15 coordinate the function of the various components of Fig. 1. Operating system 41 may be one of the commercially available operating systems such as the AIX 6000^(TM) operating system or OS/2^(TM) operating system available from IBM (AIX 6000 and OS/2 are trademarks of
20 International Business Machines Corporation); Microsoft's Windows 95^(TM) or Windows NT^(TM), as well as UNIX and AIX operating systems. Application programs 40 controlled by the system are moved into and out of the main memory RAM
14. These programs include the program of the present
25 invention to be subsequently described in combination with any conventional Web browser, such as the Netscape 3.0^(TM) or Microsoft's Explorer^(TM). A read only memory (ROM) 16 is connected to CPU 10 via bus 12 and includes the basic input/output system (BIOS) that controls the
30 basic computer functions. Random access memory (RAM) 14, I/O adapter 18 and communications adapter 34 are also interconnected to system bus 12. I/O adapter 18 may be a small computer system interface (SCSI) adapter that

S62F T 4505T60

communicates with the disk storage device 20.

Communications adapter 34 interconnects bus 12 with an outside network enabling the data processing system to communicate with other such systems over a local area
5 network (LAN) or wide area network (WAN), which includes, of course, the Web or Internet. I/O devices are also connected to system bus 12 via user interface adapter 22 and display adapter 36. Keyboard 24 and mouse 26 are all
10 interconnected to bus 12 through user interface adapter 22. It is through such input devices that the user may interactively relate to the programs for bookmarking according to the present invention. Display adapter 36 includes a frame buffer 39, which is a storage device
15 that holds a representation of each pixel on the display screen 38. Images may be stored in frame buffer 39 for display on monitor 38 through various components such as a digital to analog converter (not shown) and the like. By using the aforementioned I/O devices, a user is capable of inputting information to the system through
20 the keyboard 24 or mouse 26 and receiving output information from the system via display 38.

Before going further into the details of specific embodiments, it will be helpful to understand from a more general perspective the various elements and methods
25 which may be related to the present invention. Since a major aspect of the present invention is directed to documents, such as Web pages, transmitted over networks, an understanding of networks and their operating principles would be helpful. We will not go into great
30 detail in describing the networks to which the present invention is applicable. Reference has also been made to the applicability of the present invention to a global network such as the Internet. For details on Internet

2025 RELEASE UNDER E.O. 14176

nodes, objects and links, reference is made to the text, Mastering the Internet, G. H. Cady et al., published by Sybex Inc., Alameda, CA, 1996.

Any data communication system which interconnects or
5 links computer controlled systems with various sites
defines a communications network. A network may be as
simple as two linked computers or it may be any
combination of LANs or WANs. Of course, the Internet or
Web is a global network of a heterogeneous mix of
10 computer technologies and operating systems. Higher
level objects are linked to the lower level objects in
the hierarchy through a variety of network server
computers. These network servers are the key to network
distribution such as the distribution of Web pages and
15 related documentation. The HTML language is described in
detail in the text entitled Just Java, particularly at
Chapter 7, pp. 249-268, dealing with the handling of Web
pages and also in the above-referenced Mastering the
Internet, particularly pp. 637-642 on HTML in the
20 formation of Web pages. In addition, significant aspects
of this invention will involve Web browsers. A general
and comprehensive description of browsers may be found in
the above-mentioned Mastering the Internet text at pp.
291-313.

25 A generalized diagram of a portion of an Internet,
which the computer 56 controlled display terminal 57 used
for Web page or other document display of the present
invention, is connected as shown in Fig. 2. Computer 56
and display terminal 57 are the computer system shown in
30 Fig. 1 and connection 58 (Fig. 2) is the network
connection shown in Fig. 1. Reference may be made to the
above-mentioned Mastering the Internet, pp. 136-147, for
typical connections between local display workstations to

09190554-455060

the Internet via network servers, any of which may be used to implement the system on which this invention is used. The system embodiment of Fig. 2 is one of these known as a host-dial connection. Such host-dial

5 connections have been in use for over 30 years through network access servers 53 which are linked 51 to the Internet 50. The servers 53 are maintained by a service provider to the client's display terminal 57. The host's server 53 is accessed by the client terminal 57 through a

10 normal dial-up telephone linkage 58 via modem 54, telephone line 55 and modem 52. The HTML files representative of the Web pages are downloaded to display terminal 57 through controlling server 53 and computer 56 via the telephone line linkages from server 53 which may

15 have accessed them from the internet 50 via linkage 51.

Operating with HTML documents in frames and the construction of such documents is described in the text, Dynamic HTML in Action, Michele Petrovsky, published by Osborne, McGraw-Hill, Berkeley, CA, 1998, particularly at

20 pages 150-157. The frames are not documents, they define the parameters which documents with assigned HTML tags fill. In most conventional Web browsers, a window is anything within which you may display a defined HTML document. In the present invention, since the HTML

25 contents of the frames defining the basic Web page and its related secondary documents are related, their respective frames may be referenced to each other in a frame set. Fig. 8 is a very generalized illustration of a data structure defining a frame set showing the

30 relationships of the basic Web page frame and its related secondary documents. To simplify, for purposes of illustration, the frame set may be considered to comprise a stack of frames arranged in an overlapping window data

structure. The frames in which the respective HTML contents of Web page and its secondary documents are stored, each comprise a main frame such as frame 81 containing the basic Web page HTML and main frames 82 to 84, each respectively containing the HTML contents of a secondary document within the Web page, as well as an individual HTML name. Each of these main frames has an associated global frame 80 which contains the global information correlating the main frame with the other main frames in the set. In this manner, as will be hereinafter described in greater detail, after the HTML contents of and the name of a particular secondary document frame 82 - 84 have been individually bookmarked, when the secondary document is directly accessed through its bookmark and displayed, its associated Web page and other secondary documents may be accessed based upon the connecting information in the global frames 80.

Now with respect to Figs. 3 through 5, we will provide an illustrative example of how the present invention may be used to bookmark a Web page in the customary manner on a browser and how secondary documents on the page may be bookmarked in accordance with the present invention. When the screen images are described, it will be understood that these may be rendered by storing image and text creation programs, such as those in any conventional window operating system and in a standard browser program in the RAM 14 of the system of Fig. 1. The operating system is diagrammatically shown in Fig. 1 as operating system 41. The display screens of Figs. 3 through 7 are presented to the viewer on display monitor 38 of Fig. 1. In accordance with conventional techniques, the user may control the screen interactively through a conventional I/O device such as mouse 26, Fig.

1, which operates through user interface 22 to call upon programs in RAM 14 cooperating with the operating system 41 to create the images in frame buffer 39 of display adapter 36 to control the display on monitor 38.

5 The initial display screen of Fig. 3 shows a display screen where a browser program, Microsoft Internet Explorer^(TM), has been used to access a Web page 63 into display space 61. In addition, the selecting of a link 62, "Satisfaction", from the options on the Web page 63, which has resulted in the accessing and display of secondary document 64, entitled "Satisfaction". At this point, the user may add a bookmark back to his whole Web page 63 by clicking on "Favorites" (bookmark) option 67 on the basic menu bar which will cause the browser program to add the whole Web page entitled "IBM Easy" to be bookmarked in the conventional browser manner. If the user wishes to bookmark the secondary document 64, then the user presses bookmarking feature 65 (Favorites) when the user cursor is within secondary document 64. This is the feature provided by this invention to be used only for the bookmarking of secondary documents. This results in the appearance of prompt 66, but this time the user follows its instructions and goes on to select the Favorites option 67 from the menu bar that results in drop down menu 68, Fig. 4, which in addition to a selection of already bookmarked Favorites contains the option 71 "Add to Favorites". Then, when the user selects the option 71 the result is dialog panel 72 appearing, Fig. 5, from which, the user then may, by confirming the option 73 by pressing the standard OK button, cause the secondary document 64 to be bookmarked and added to the list of bookmarked documents in Favorites menu 68. It should be noted that this

confirmatory selection 73 results in whichever frame in the stored frame set shown in Fig. 8 being brought to the top of the stack. If we would assume that the HTML for document 64 would be in frame 84 then that frame 84 would be brought to the top of the frame set stack so that it could be appropriately bookmarked. When a bookmarked secondary document is subsequently accessed through its bookmark, it still retains its connections with the basic Web page and other secondary documents on the Web page by means of JavaScript code embedded in HTML text of the secondary bookmarked document. Thus, when a secondary bookmarked document is accessed through its bookmark, the basic browser being used interprets the JavaScript code in the bookmarked secondary document and displays all other secondary documents associated with it.

JavaScript is a conventional simple interpreted scripting language that enables Web page developers to embed simple Java-like programming instructions within the HTML text of Web pages. For further information with respect to the use of JavaScript within HTML text in Web page frames, reference is made to the above-mentioned text, Dynamic HTML in Action, Petrovsky, particularly at pages 150-158 and 184-185.

Now with reference to Figs. 6 and 7 we will describe a process implemented by the present invention in conjunction with the flowcharts of these figures. Fig. 6 is a flowchart showing the development of a process according to the present invention for enabling a user of a Web page to bookmark secondary documents within the page. With reference to Fig. 6, first, process step 101, in implementing the program the Web page developer is provided with the facility of creating within the Web page, HTML frames which are independent of the Web page,

but nonetheless globally connected to the Web page as described with respect to Fig. 8. The developer may, of course, put content into the framed documents, step 102. Then, step 103, a conventional Web browser program is
5 provided at the Web page receiving display station, e.g. the computer controlled display of Fig. 1 or display station 56, 57 of Fig. 2. The Web browser provides for the bookmarking of Web pages in the conventional manner, step 104. A program routine is provided at the receiving
10 display station for designating a HTML frame representing a secondary document in the Web page to be added to bookmarks, step 105, e.g. Figs. 3, and in response to such a request, providing a dialog box for adding such a bookmark, step 106, (see "Add to Favorites" entry Fig. 4
15 and confirmatory dialog box entry 73 in Fig. 5). Lastly, step 107, a process is provided for bringing the designated HTML frame to the top of the stored frame set data whereby the top frame is added to the conventional list of bookmarks in the browser, as described with
20 respect to Fig. 8.

The running of the process will now be described with respect to Fig. 7. First, step 111, when there is a received Web page, the browser program loads the page into the receiving computer display, step 111. Then a
25 determination is made as to whether the user has pressed the bookmark, i.e. "Favorites" button, decision step 112. If No, there may be a determination made, step 113, as to whether the session is over. If Yes, then exit. Let us assume No, then the flow returns to 112 where the user
30 continues to work with the page until the bookmark button is pressed and the step 112 decision is Yes. At this point a determination is made via decision step 114 as to whether the user, i.e. cursor, is in the Web page in

2025 RELEASE UNDER E.O. 14176

general or in a particular HTML frame. If there is a No decision from step 114 indicating that the user is not in any frame and, thus, is in the Web page in general, the conventional browser program is permitted to designate the Web page as bookmarked and add the Web page to the standard browser list, step 115, and the process is then returned to step 112. On the other hand, if the decision from step 114 is Yes, then the user is urged via prompt 66, Fig. 3, to select "Add to Favorites" from the Favorites menu 68, Fig. 4, which then has to be confirmed via dialog box selection 73, Fig. 5. Note that the user may at this point decide not to add a bookmark at either stage of Fig. 4 or Fig. 5. In such a case, the decision from step 117 would be No and the process would return to step 112, Fig. 7. However, if the decision from step 117 is Yes, the user chooses to add the bookmarked secondary frame HTML page to the bookmark list, then, step 118, the frame in the set containing the secondary page will be brought to the top of the stored frame set as described with respect to Fig. 8 and the bookmarked secondary page will be added to the standard "Favorites" list, step 119, after which the process returns to step 112 where a determination is made as to further bookmarks.

One of the preferred implementations of the present invention is as an application program 40 made up of programming steps or instructions resident in RAM 14, Fig. 1, during computer operations. Until required by the computer system, the program instructions may be stored in another readable medium, e.g. in disk drive 20, or in a removable memory such as an optical disk for use in a CD ROM computer input, or in a floppy disk for use in a floppy disk drive computer input. Further, the program instructions may be stored in the memory of

another computer prior to use in the system of the present invention and transmitted over a LAN or a WAN, such as the Internet, when required by the user of the present invention. One skilled in the art should

- 5 appreciate that the processes controlling the present invention are capable of being distributed in the form of computer readable media of a variety of forms.

- Although certain preferred embodiments have been shown and described, it will be understood that many
10 changes and modifications may be made therein without departing from the scope and intent of the appended claims.

0919064-46906160

Claims

8 means associated with one of said receiving display
9 stations for bookmarking selected transmitted documents
10 to thereby store at said receiving display station,
11 direct links to the documents for future access,

15 means at said receiving display station for
16 bookmarking said secondary document to thereby store at
17 said receiving display station, a direct link to the
18 secondary document, said link circumventing said
19 transmitted document.

1 3. The system of claim 2 wherein the transmitted
2 documents are hypertext documents.

1 4. The system of claim 3 wherein the transmitted
2 documents are Web pages in Hypertext Markup Language.

1 5. The system of claim 4 wherein said secondary document
2 is defined by frames within a Web page and is also in
3 Hypertext Markup Language.

1 6. The system of claim 5 further including:
2 means for displaying a list of said bookmarked
3 documents, and
4 means for adding said secondary bookmarked documents
5 to said list.

1 7. The system of claim 5 further including:
2 means for accessing and displaying said secondary
3 documents via said direct link, and
4 means for maintaining connections between said
5 secondary documents and said transmitted documents,
6 whereby said transmitted documents may be accessed and
7 displayed through said accessed secondary documents.

1 8. In a computer managed communication network with user
2 access via a plurality of data processor controlled
3 interactive display stations and with a system for
4 displaying documents transmitted to said display stations
5 from locations remote from said stations, a method for
6 bookmarking sections of said transmitted documents
7 comprising:

8 bookmarking at one of said receiving display
9 stations selected transmitted documents to thereby store
10 at said receiving display station, direct links to the
11 documents for future access,

12 defining in a transmitted document at least one
13 section as an independent secondary document, and

14 bookmarking said secondary document at said
15 receiving display station to thereby store at said

09100554-11308

16 receiving display station, a direct link to the secondary
17 document without accessing said transmitted document.

1 9. The method of claim 8 wherein said network is the
2 World Wide Web.

1 10. The method of claim 9 wherein the transmitted
2 documents are hypertext documents.

1 11. The method of claim 10 wherein the transmitted
2 documents are Web pages in Hypertext Markup Language.

1 12. The method of Claim 11 wherein said secondary
2 document is defined by frames within a Web page and is
3 also in Hypertext Markup Language.

1 13. The method of claim 12 further including the step
2 of:
3 displaying a list of said bookmarked documents, and
4 adding said secondary bookmarked documents to said
5 list.

1 14. The method of claim 12 further including the steps
2 of:
3 accessing and displaying said secondary documents
4 via said direct link, and
5 maintaining connections between said secondary
6 documents and said transmitted documents, whereby said
7 transmitted documents may be accessed and displayed
8 through said accessed secondary documents.

1 15. A computer program having code recorded on a
2 computer readable medium for bookmarking sections of

0019054-4306160

3 transmitted documents in a computer managed communication
4 network with user access via a plurality of data
5 processor controlled interactive display stations and
6 with a system for displaying documents transmitted to
7 said display stations from locations remote from said
8 stations comprising:

9 means for bookmarking selected transmitted documents
10 to thereby store at a receiving display station, direct
11 links to the documents for future access,

12 means in a transmitted document defining at least
13 one section in the document as an independent secondary
14 document, and

15 means for bookmarking said secondary document to
16 thereby store at said receiving display station, a direct
17 link to the secondary document without accessing said
18 transmitted document.

1 16. The computer program of claim 15 wherein said
2 network is the World Wide Web.

1 17. The computer program of claim 16 wherein the
2 transmitted documents are hypertext documents.

1 18. The computer program of claim 17 wherein the
2 transmitted documents are Web pages in Hypertext Markup
3 Language.

1 19. The computer program of claim 18 wherein said
2 secondary document is defined by frames within a Web page
3 and is also in Hypertext Markup Language.

0919954-1493

1 20. The computer program of claim 19 further including:
2 means for displaying a list of said bookmarked
3 documents, and
4 means for adding said secondary bookmarked documents
5 to said list.

1 21. The computer program of claim 19 further including:
2 means for accessing and displaying said secondary
3 documents via said direct link, and
4 means for maintaining connections between said
5 secondary documents and said transmitted documents,
6 whereby said transmitted documents may be accessed and
7 displayed through said accessed secondary documents.

2025 RELEASE UNDER E.O. 14176

**BOOKMARKING OF WEB PAGE FRAMES IN WORLD WIDE WEB
FOR ACCESSING WEB PAGES WITHIN A FRAMES IMPLEMENTATION**

Abstract

A process in a computer managed communication
5 network such as the World Wide Web with user access via a
plurality of data processor controlled interactive
display stations and with a system for displaying
documents, e.g. Web pages, transmitted to said display
stations from locations remote from said stations which
10 provides the user with the option of bookmarking a whole
document or just sections of the document. Conventional
means associated with one of said receiving display
stations are provided for bookmarking selected
transmitted documents, e.g. whole Web pages to thereby
15 store at said receiving display station, direct links to
the documents for future access. In combination with
this function, the invention provides the document or Web
page creator with the facility of defining one or more
sections of the document or Web page as independent
20 secondary documents together with the facility at the
receiving display station for optionally bookmarking any
secondary document to thereby store at the receiving
display station, a direct link to the secondary document
without accessing the basic transmitted document. The
25 invention is implemented by designing both the basic and
secondary documents as hypertext, particularly HTML
documents, with JavaScript and defining the secondary
documents within the basic document or Web page. While
the secondary or framed documents may be bookmarked so
30 that they may be accessed without first accessing or
going through their primary transmitted document, i.e.
Web page, nonetheless a feature of the present invention
is that once the secondary document is, thus, directly

0916054-11293
SECRET

accessed, its related Web page and, consequently, other secondary documents on the Web page may then be accessed through the accessed bookmarked secondary document.
